

Interpretation of Findings

Resume Completion Rates by City

The bar chart highlights significant variation in resume completion rates across cities. Cities such as Maitland, Poinciana, Mulberry-Lakeland, and Altamonte Springs show near-100% completion rates, indicating strong engagement and likely effective support systems or motivated participants in these regions. Mid-range cities such as Orlando, Kissimmee, and Apopka cluster around 60–70%, showing steady but improvable engagement. Certain locations like Davenport, Saint Cloud, and Auburndale report very low completion percentages, some under 20%. In summary, there should be more focus on underperforming cities with low resume completion rates, while best practices from high-performing areas could be replicated.

Pareto Chart of Clients per Staff

The Pareto chart shows client distribution across four staff members: Raymond, Joycelyn, Ari, and Damiaka. Each staff member handles an equal number of clients since the bars are identical (all staff had one client count recorded), leading to a flat cumulative distribution. The 80/20 rule is not evident here, as there is no concentration of clients among a smaller subset of staff. The workload is evenly distributed across staff, which reduces risk of

burnout and ensures fairness. However, it also suggests no staff member is contributing disproportionately to outcomes. In the future, more should be done to explore quality of client support rather than raw client counts.
